

# When Planning, Specifying and Ordering Your Palletflo System

From the very earliest stage of planning your live storage system, Kornylak offers help in a variety of forms - advice, comparisons of storage forms, case histories, system layouts and actual tests. Tests run at Kornylak's facility are useful not only to demonstrate performance of special pallets or loads in a specific environment but also to determine the lowest cost rail capable of meeting all conditions. Such tests may be witnessed, but should it be inconvenient for you to visit, a report, photos, recorder charts or video tapes can be mailed to you for review.

Helpful data to speed up the advice process includes **pallet description** - bottom board sizes, orientation and spacing; **load description** - weight, stability, height, overhang; **environment** - temperature range, moisture, dust; **space** - area, height, obstructions such as columns, ducts, pipes, exits; **storage capacity desired** - number of loads, bays wide, tiers high and length of lane and proposed method of replenishing and load removal.

Early consultation adds to the quality of your final installation.

CONSULT OUR PLANT IF THESE DIMENSIONS DO NOT SUIT YOUR APPLICATION
